

Release Notes “Spring 2020”

Devensoft listens to customer feedback and delivers updates periodically to improve the individual user experience while managing the M&A lifecycle. Below is a brief description of new and updated features to the Devensoft M&A platform.

Product Feature Updates:

Introducing New Hierarchy Level

- Our application has six (6) levels to support detail work plans and customized playbook activities. Hierarchy levels are Project, Category, Workstream, Milestone, Task and SubTask.

Deletion Capability added to Activity Map import

- In the Activity Map export file, a new column has been added called “Activity” with a drop-down option, “Delete.” This will help in deleting multiple items at the same time
- When importing a file, the Import Wizard has a new Delete option added that states the purpose of that option. This is an additional check for users to select Delete if needed. When selecting this option, other updates will not be entertained. Likewise, if user does not select Delete in this screen but still has some deletes marked in the spreadsheet, it will be ignored.

Decisions Page Added for Targets

- Similar to Integrations, Decisions can be added and managed under the Decisions tab of a Target.

Product Improvements:

Administration

- In the User Detail page, the Export and Import functionality has been divided into two separate permissions, which adds flexibility for user access.
- User Administration/Export – The import process has improved to support Custom and Limited roles and Access permissions for new users and updating existing users.
- Tags feature has been enhanced to configure as a drop-down list or free text. Drop down list can be customized similar to picklist by Administrators with various options.

Activity Map

- Issue/Risks/Actions/Decisions pages have been enhanced to show data on multiple pages when there are so many activities.
- Dynamic filtering populates drop-down values based specifically on user's selections. This feature is now available on most pages for a better customer experience.

Report

- Audit Report to show only content changes.

Session Timeout Message

- After 60 minutes of inactivity, a "Session Timeout Message" will appear on the Login screen so user is clear why they are logged out.

Performance and Security Improvement

- Several performance improvements have been made throughout the application specifically in Activity Map when there is large set of data loaded.
- Documents are scanned before adding into the application to prevent corrupted files getting imported. This reduces application exposure to malware and virus attack.
